### Abstract

An innovative biological energy has been observed related to the eye sight and fusing with another energy over tap water through a small metallic chain. The fused energy has been repeatedly described under standard conditions and its characteristics vary according to the condition of the eye sight and the water content. This energy may be called: "EFI" (energy functioning, by fusion, independently).

### Description

It has been observed and repeatedly studied, during the last two years that under the immediate influence of the sight of our eyes, a static energy is transmitted on a small metallic chain of about 1,5mm wide having an ending heavier part of 1x0,4cm. This energy when hanging over tap water is transformed into another energy which can move the above metallic chain. This chain is of a white color probably of silver and it is hold by the three fingers of our hand (Figure 1).

The above condition was standardized as follows: The best length of the chain in order to induce the above movements is 20cm and its lower end was placed about 4cm above the surface of tap water. Tap water is in a cyclic container with 21 cm diameter, containing water in a depth of 4cm. When the length of the chain was 10cm, 15cm or 25cm the test was less effective. The repeatability was secured by signs placed under the water container and at the side of it (Figure 1).

**Figures 1,2.** The metallic chain remains at first steady over the water and then moves in a cyclic manner, progressively faster.

After trying to keep the above conditions steady, we observed the following:

- When a female was holding the chain the movement of the chain was clockwise, while in a male it was anti-clockwise.
- At first the chain remains steady and trembling for about 15-20sec and then starts moving fast (Figures 1, 2).
- By closing both eyes of the person doing the test these cyclic movements of the chain stops. By closing one eye, the movements diminish. If the eye we close is defected, by clo-

sing this eye the movement is hardly influenced. Occasional thoughts during the test immediately diminish the movements of the chain.

d) When the chain is placed above dead, dry leaves, it remains always steady (unmovable) (Figure 3).

**Figure 3.** No movement over dry leaves.

e) When the chain is placed above living green leaves, just taken from their plant within 30sec, it runs a clockwise movement no matter if the chain is hold by a male or a female (Figure 4).

**Figures 4 and 5.** Under the same standard conditions, Figure 4 shows intense movement of the chain over green living leaves and Figure 5 shows very little movement over white greenish fat leaves (Fotos were taken at different angles. The movement in Figure 4 was clockwise and in Figure 5 anti-clockwise).

f) When the chain is placed above freshly taken fat leaves (of 3mm), white greenish in color (poor in chlorophyll) it has an anti-clockwise movement no matter if the chain is hold by a male or a female (Figure 5).

## Discussion

There is no doubt that by fusing two different static energies, one from our eyes through the chain and the other from the water we have an active energy which may take many forms and has many characteristics. There is also no doubt that the above tests as presented above must be repeated by others and also under different conditions.

Since water is a major constituent of life, experiments to indicate normal function and disease by the above test are welcome. It is obvious that this energy is of no harm to men [1].

Long ago, Henrique Rodriguez and other researchers have expressed views and performed experiments on plants and bacteria showing that plants and especially their leaves emit a kind of an unidentified energy which they were able to photograph. Similar findings in bacteria [2, 3]. Our observations indicate that there is an energy very widely distributed in plants, in men and in nature, produced after fusion and functioning independently (no electricity, petrol etc is required). We thus call this energy: "Energy Functioning Independently-EFI" from the name of the lady that first noticed it: Fani-Efi-Melphou.
